1. INTRODUCTION:

The Testing Phase is an important phase of the project development process. The main objective of this phase is to verify that the developed Auto Ticket Classification using Flow Designer system works correctly according to the specified requirements. Testing is performed to ensure that the system automatically classifies IT support tickets based on the information provided by the user. The system checks the Short Description and identifies the type of issue. Based on the identified issue, the appropriate Category and Subcategory are automatically assigned. The main purpose of this phase is to validate the complete working of the system from ticket creation to automatic classification and notification.

2. OBJECTIVES OF TESTING:

The main objectives of the Testing Phase are:

- ❖ To verify that the developed system works according to the requirements.
- ❖ To verify automatic classification of IT support tickets.
- ❖ To verify that the correct Category is assigned.
- ❖ To verify that the correct Subcategory is assigned.
- ❖ To verify the email notification functionality.
- ❖ To validate the ticket information stored in the system.

3. TESTING AND VALIDATION

- Testing and validation are performed to ensure that the developed system produces the expected output for different types of IT support requests.

The system is tested using different test scenarios such as:

- ❖ Wi-Fi related issue.
- ❖ Projector related issue.

- ❖ Password related issue.
- ❖ Slow Computer related issue.

For each test scenario, a Caller Name and Short Description are entered into the Incident Workflow form. After saving the record, the Flow Designer automatically processes the ticket and assigns the appropriate Category and Subcategory. The testing process also checks whether an email notification is sent to the caller after the ticket is created.

4. DATA VALIDATION CHECKS:

The following data validation checks are performed during the testing phase:

- Mandatory fields are captured correctly.
- Auto-number is generated without duplication
- Reference fields resolve correctly to the user and group tables.
- Ticket information is stored in a structured format.
- These validation checks ensure that the data entered into the system is accurate and consistent.

5. ACTIVITY: 1 – TESTING & VALIDATION:

The first activity of the testing phase is to test the automatic ticket classification functionality.

Testing Steps:

- ❖ Open the Incident Workflow form.
- ❖ Enter one Caller Name.
- ❖ Enter the issue in the Short Description field.
- ❖ Then Save the Form.
- ❖ Reload the Form.
- ❖ Check the automatically assigned Category.
- ❖ Check the automatically assigned Subcategory.
- ❖ Verify the email notification sent to the caller.

6. TEST SCENARIO 1 – WI-FI ISSUE:

Test Case ID: TC001

Objective

- To verify whether the system automatically identifies and classifies a Wi-Fi related issue.

Input

Caller Name: Enter one valid caller.

Short Description: Wi-Fi not working in library

Testing Type

- Open the Incident Workflow form.
- Enter one Caller Name.
- Enter “Wi-Fi not working in library” in the Short Description field.
- Then Save the Form.
- Reload the Form.
- Check the Category field.
- Check the Subcategory field.
- Verify the email notification.

Expected Result

The system should automatically assign:

- Category → Network
- Subcategory → Wi-Fi
- An email notification should also be sent to the caller.

Actual Result

The ticket is automatically classified as:

- Category → Network
- Subcategory → Wi-Fi
- The email notification is successfully sent to the caller.
- Test Status
- PASS
- The reference project uses the Wi-Fi scenario with the same expected Category, Subcategory and email validation.

7. ACTIVITY: 2 – CHECK EMAIL NOTIFICATION:

After the ticket is classified, an email notification is sent to the caller using Flow Designer.

Navigation Steps

- Open All menus.

- Search for Emails.
- Under System Logs, select Emails.
- Search with the given Subject Name.
- Open the email record.

Verify the email subject and message.

Expected Result:

- The email notification should be generated successfully and delivered to the caller.

8. TEST SCENARIO 2 – PROJECTOR ISSUE:

Test Case ID: TC002

Objective

To verify whether the system automatically identifies and classifies a Projector related issue.

Input

Caller Name: Enter one valid caller.

Short Description: Projector not turning on.

Testing Steps

- Open the Incident Workflow form.
- Enter one Caller Name.
- Enter “Projector not turning on” in the Short Description field.
- Then Save the Form.
- Reload the Form.
- Check the Category field.
- Check the Subcategory field.
- Verify the email notification.

Expected Result

The system should automatically assign:

Category → Hardware

Subcategory → Projector

An email notification should be sent to the caller.

Actual Result

The ticket is automatically classified as:

Category → Hardware

Subcategory → Projector

The email notification is successfully sent to the caller.

Test Status

PASS

The reference project uses the Projector issue as the second testing scenario and verifies the automatic Hardware and Projector classification.

9. ACTIVITY: 3 – PASSWORD ISSUE CLASSIFICATION:

Test Case ID: TC003

Objective

To verify whether the system automatically identifies and classifies a Password related issue.

Input

Caller Name: Enter one valid caller.

Short Description: Forgot password for login.

Testing Steps

- Open the Incident Workflow form.
- Enter the Caller Name.
- Enter “Forgot password for login” in the Short Description field.
- Then Save the Form.
- Reload the Form.
- Check the Category field.
- Check the Subcategory field.
- Verify the email notification.

Expected Result

The system should automatically assign:

Category → Access

Subcategory → Forgot Password

Actual Result

The system correctly identifies the Password related issue and assigns the appropriate Category and Subcategory.

Test Status

PASS

The Flow Designer configuration contains a condition for password related issues and updates the record with Access and Forgot Password.

10. ACTIVITY: 4 – SLOW COMPUTER CLASSIFICATION:

Test Case ID: TC004

Objective

To verify whether the system automatically identifies and classifies a Slow Computer related issue.

Input

Caller Name: Enter one valid caller.

Short Description: Computer is slow.

Testing Steps:

- Open the Incident Workflow form.
- Enter the Caller Name.
- Enter “Computer is slow” in the Short Description field.
- Then Save the Form.
- Reload the Form.
- Check the Category field.
- Check the Subcategory field.
- Verify the email notification.

Expected Result:

The system should automatically assign:

Category → Performance

Subcategory → Slow Computer

Actual Result:

The system correctly identifies the Slow Computer issue and assigns the appropriate Category and Subcategory

Test Status:

PASS

The Flow Designer contains a separate condition for Slow Computer classification and updates the Category and Subcategory accordingly.

11. ACTIVITY: 5 – CATEGORY AND SUBCATEGORY VALIDATION

The Category and Subcategory fields are validated to ensure that the correct values are assigned according to the issue.

The following classifications are verified:

- Wi-Fi → Network
- Projector → Hardware
- Forgot Password → Access
- Slow Computer → Performance

The Category and Subcategory values must match the issue mentioned in the Short Description. If the Short Description contains Wi-Fi, the system assigns Category as Network and Subcategory as Wi-Fi. If the Short Description contains Projector, the system assigns Category as Hardware and Subcategory as Projector. If the Short Description contains Password or Login, the system assigns Category as Access and Subcategory as Forgot Password. If the Short Description contains Slow or Hanging, the system assigns Category as Performance and Subcategory as Slow Computer.

12. ACTIVITY: 6 – AUTO NUMBER VALIDATION:

The Auto Number field is tested to ensure that every newly created ticket receives a unique ticket number.

Testing Steps

- Create a new ticket.
- Save the ticket.
- Check the generated ticket number.
- Create another ticket.
- Check the second ticket number.
- Compare both ticket numbers.

Expected Result

Each newly created ticket should receive a unique auto-generated number without duplication.

Test Status

PASS

13. ACTIVITY: 7 – REFERENCE FIELD VALIDATION:

The reference fields are tested to ensure that they correctly refer to the required users and groups.

Testing Steps

- Open the Incident Workflow form.
- Select a valid Caller.
- Verify the selected user information.
- Select the required Assigned Group.
- Save the record.
- Reload the form.

- Verify the reference values.

Expected Result

The Caller and Assigned Group reference fields should correctly display the selected user and group information.

Test Status

PASS

14. ACTIVITY: 8 – OVERALL TESTING RESULT:

After completing all the test scenarios, the major functionalities of the system are verified. The following functionalities are successfully tested:

- Ticket creation.
- Automatic ticket classification.
- Category assignment.
- Subcategory assignment.
- Category and Subcategory dependency.
- Auto-number generation.
- Reference field validation.
- Email notification.
- Data storage and validation.

The testing results confirm that the Flow Designer automation works correctly for the defined IT support issues. Test

15. TESTING SUMMARY:

TEST CASE	SHORT DESCRIPTION	CATEGORY	SUBCATEGORY	STATUS
TC001	Wi-Fi is not working in	Network	Wi-Fi	Pass
TC002	Projector not turning on	Hardware	Project	Pass
TC003	Forgot password	Access	Forgot password	Pass
TC004	Computer is slow	Performance	Slow computer	Pass

16 TESTING FINAL RESULT:

- The Testing Phase successfully validates the Auto Ticket Classification using Flow Designer project. The different test scenarios confirm that the system can automatically identify common IT support issues based on the Short Description.
- The validation process confirms that mandatory fields, auto-number generation, Category, Subcategory, and reference fields are working correctly.

16. CONCLUSION:

The Testing, Validation and Security phase confirms that the developed Auto Ticket Classification using Flow Designer system performs the required functions correctly. The test scenarios for Wi-Fi, Projector, Password, and Slow Computer issues demonstrate that the automation works as expected. The email notification and data validation processes are also successfully verified. Overall, the testing phase ensures that the system meets the defined functional requirements and provides a structured and automated solution for handling IT support tickets.
